Meridian AI - Commercial Terms

Executed amendment - 18 September 2026

For planning from 1 October through 31 December 2026, Managed-P rates are USD 6 per million input tokens and USD 24 per million output tokens. A monthly minimum of USD 2500 applies to the sum of Managed-P input and output charges. The minimum is not additive: invoice the larger of usage charges and USD 2500. This commitment survives all deployment plans through December. Cached input is not charged. Retries remain billable. There is no output-token cache discount. The executed schedule applies to prospective quarter usage and is not a restatement of September historical expense.

Transition quotes

P1 costs USD 18000, P2 USD 8000 and P3 USD 10000 once, at quarter start. Repeated quote amounts in the option register describe the same plan-level quote and must not be summed by mapping row. These quotes include migration preparation, operational acceptance and the initial change window. No additional transition expense has been approved. All plans retain the resident pool for restricted accounts. The planning comparison charges the complete transition amount in October rather than spreading the payment across an assumed useful life.

Service and quality requirements

Restricted accounts may use only Local-L. Each deployed model/use-case cell must have replay pass rate at least 0.94 and replay p95 latency at most 3000 ms. Use the ratio of total passes to total evaluated for quality. Replay p95 is the maximum batch p95 in that cell. A plan must also satisfy the resident capacity conditions in the approved planning policy. These conditions are evaluated before selecting a contribution maximiser; a financially attractive plan cannot waive them merely by identifying a lower invoice.

Eligible infrastructure quotations

The infrastructure offer register retains quotations for several pools and monthly periods, including earlier revisions. Only rows marked award_eligible true can support the restricted production workload under the present approval. Within each offer identifier, the highest revision supersedes earlier rows. Effective dates are recorded for audit. Select the eligible current quotation for the relevant month. Rates and measured throughput belong to that month and must not be borrowed from an ineligible pool. A lower historical quotation is not an available discount unless it remains the controlling revision.

Routing register governance

The deployment register contains repeated mapping identifiers because the operations team retains rule revisions. The highest revision for a mapping identifier is the approved route rule. Each current rule identifies a plan and a route group. The customer forecast assigns each account to one route group and states its use case and data class. Earlier rules are retained to explain changes, not to create additional production traffic. A current rule must match its group characteristics before its model assignment can be used in the financial comparison.

Invoice boundary and cost ownership

Managed-P charges are provider inference invoices. Resident hardware is purchased through reserved GPU hours and does not also incur Managed-P token rates. Platform overhead is separate from these two cost categories. Cache savings affect eligible input tokens only. Retry token quantities already include the incremental processing attributed to failed attempts, so adding a second waste surcharge would duplicate expense. No unquoted support charge, carbon credit, speculative rebate or customer price increase is authorised in the current quarter comparison.

Customer revenue commitments

The customer forecast contains contracted monthly revenue by account. A volume multiplier affects expected usage and cost, not the fixed subscription amount. An account may therefore generate more inference activity without generating a proportional increase in revenue. The quarter includes October, November and December once each. Account names are descriptive labels; the account identifier controls the relationship to operational records. Do not treat individual attempts, request revisions or repeated route mappings as additional customers with additional subscriptions.

Superseded commercial schedule - retained for audit

The July draft quoted USD 4 input and USD 14 output per million, with no monthly minimum. That draft was never executed and is superseded by the September amendment. No September historical expense is carried into the prospective quarter. The retained draft is evidence of a prior negotiation, not an alternative executable contract. Procurement has not approved cancellation of the managed commitment, even if a proposed architecture routes no requests through Managed-P during one of the prospective months.

Approval and change control

The investment committee approves a complete plan rather than individual model substitutions selected after the comparison. A later request to alter route groups, pool eligibility, transition scope or service thresholds requires a new review. Production acceptance must confirm that the approved mapping can be implemented without relaxing customer restrictions. The financial owner must preserve the comparison supporting the decision so later changes can be assessed against the assumptions actually used at approval. An approval does not guarantee future workload, cost or model behaviour.

Administration and review

Retain all billing evidence. File each signed amendment. Record unresolved commercial questions. Keep account identifiers unchanged. Document the review date. Do not assume automatic renewal. Operational owners should retain the original exports alongside any reconciled analytical tables used for committee review. A reference to a customer describes its account identifier and does not authorise disclosure of confidential information. Commercial comparisons should use the same quarter boundaries for every alternative and should identify material limitations. The committee may request supporting records whenever a reported amount cannot be traced to the supplied materials. Any later change to a quoted amount requires a new approval record before implementation can proceed. Procurement staff should record which version was accepted and retain the earlier correspondence for the audit trail. The presence of an earlier quotation does not establish that its conditions continue to govern the proposed purchase. No meeting note, informal preference, or provisional dashboard label constitutes approval of a deployment investment. Financial evidence should remain separate from promotional claims about prospective product capabilities or customer satisfaction. An unresolved discrepancy must be described rather than replaced with an unsupported estimate that favours a preferred plan. The review owner should distinguish an assumption changing the estimate from an error changing the calculation. Capacity forecasts remain conditional on workload shape and do not guarantee that production demand will follow historical patterns. If additional information arrives after the decision date, retain the original recommendation and document the updated comparison separately. A vendor name appearing in a register does not itself demonstrate contractual eligibility for the restricted workload. Where records share a commercial identifier, amendments should be interpreted in their effective order rather than their file position. Account managers may confirm customer commitments but cannot waive infrastructure controls on behalf of the security owner. Every reported cost should be attributable to a defined billing period, a stated unit, and a documented commercial obligation. The committee expects clear evidence of why the selected plan remains preferable after the other proposals receive equal treatment. Implementation teams should monitor the assumptions that matter to the decision instead of treating the approved estimate as permanent. A document retained for audit can be relevant background without being the controlling authority for the current period. Reviewers should not infer a contractual obligation solely from a numerical amount repeated in an operational export. Any future negotiation is a separate decision and must not be credited as a saving in the present comparison.
